DECLARATION BY CANDIDATE

We, V Dilip Reddy, Aripaka Manoj, M.S.S.K Kashyap, Bhanu Teja Vara Venkata bearing hall ticker numbers, 1602-21-737-080, 1602-21-737-094, 1602-21-737-110, 1602-21-737-121, hereby declare that the project report titled “OASIS – A Flight Booking System” for the award of the degree of Bachelor of Engineering in Information Technology.

This is a record of bonafide work carried out by me and the results embodied in this project report have not been submitted to any other university or institute for the award of any other degree or diploma.

(Head Dept. IT)

ACKNOWLEDGEMENTS

We are overwhelmed in all humbleness and gratefulness to acknowledge our debt to all those who have helped us put these ideas, well above the level of simplicity and into something concrete. We are extremely thankful to our college, Vasavi College of Engineering, Hyderabad for providing the opportunity to implement our project, " OASIS – A Flight Booking System " which helped us in learning many new things.

We would like to express our gratitude to DR. K Ram Mohan Rao, HOD IT Department, Ms. S Aruna, Associate Professor, Ms. Sree Lakshmi, Assistant Professor (Sr. Scale) for the esteemed guidance, moral support and invaluable advice provided by her for the success of the project.

We are also thankful for our friends and peers for their help and encouragement throughout the project.

V DILIP REDDY

Abstract

The project aims to create an Airways application that models the routes between airports as a graph, where each airport is a vertex and the routes between them are edges with weights representing the distance or time taken to travel between the airports. Using graph algorithms such as Dijkstra's or Bellman-Ford, the application will find the shortest path between a starting and destination airport and display the corresponding flights to the user.

Additional features can be implemented to make the application more useful for users, such as filtering flights based on user preferences, comparing prices of flights from different airlines, and allowing users to book their flights directly through the application.

ER DIAGRAM

ARCHITECTURE

JAVA SWINGS

Java swing tutorial is a part of Java Foundation Classes (JFC) that is used to create window-based applications. It is built on the top of AWT (Abstract Windowing Toolkit) API and entirely written in java. Java swing provides platform independent and lightweight components. The javax.swing package provides classes for Java swing API such as JButton, JTextField, JTextArea, JCheckbox, JOptionPane etc. which we have used to perform various functions in our project

SQL

Structured Query Language (SQL) is a database query language used for storing and managing data in Relational DBMS. SQL was the first commercial language introduced for E.F Codd's Relational model of database. Today almost all RDBMS (MySQL, Oracle, Infomix, Sybase, MS Access) use SQL as the standard database query language. SQL is used to perform all types of data operations in RDBMS. We have used Oracle database to implement our project.

JDBC

JDBC (Java Database Connectivity) is an API that provides a standard interface for connecting Java applications to relational databases. It allows developers to perform various database operations like querying, updating, and managing data through Java code. By utilizing JDBC, developers can establish connections to databases, execute SQL statements, retrieve and manipulate result sets, and handle transactions. JDBC is widely used in projects involving database-driven applications, such as web applications, desktop applications, and enterprise systems, enabling seamless integration with databases like MySQL, Oracle, and SQL Server. Its versatility, portability, and ease of use make JDBC an essential component for Java developers working with databases.

Netbeans

NetBeans is an open-source integrated development environment (IDE) primarily used for Java development. It provides a comprehensive set of tools and features to streamline the software development process. NetBeans offers a user-friendly interface, code editing

capabilities, debugging tools, and project management functionalities. It supports multiple programming languages and frameworks, allowing developers to work on diverse projects. NetBeans facilitates the creation of desktop, web, and mobile applications, providing features like code generation, version control integration, and GUI design tools. It also supports plugins and extensions, enabling developers to customize their environment. With its rich set of features, NetBeans is a popular choice for Java developers to efficiently build and maintain their projects.

TECHNOLOGY

SOFTWARE REQUIREMENTS

The following are the software used in our project –

- ☐ Java SE version 15.0.2
- ☐ Oracle 11g database – SQLPLUS 11.2.0.2.0

HARDWARE REQUIREMENTS

The hardware interface requirements ensure the software executes all requests given by the user efficiently. They are –

- ☐ Processor – Intel core i5 and above
- ☐ RAM – Minimum 2GB/4GB and above

TABELS USED

- AIRPORTS TABLE

FUTURE SCOPE

In the future, the OASIS application can expand its capabilities by integrating real-time flight tracking and notifications. By leveraging APIs from airlines or flight tracking services, the application can provide users with up-to-date information about flight delays, cancellations, or gate changes for their booked flights. This feature will enhance the user experience and help travelers stay informed and adjust their plans accordingly.

To provide a comprehensive travel planning experience, the application can also integrate with accommodation and transportation services. By incorporating hotel booking and transportation options such as car rentals or taxi bookings, users can conveniently plan their entire trip from a single platform. This integration will streamline the travel planning process and offer users a seamless experience.

Additionally, incorporating social features such as user reviews, ratings, and recommendations for airports, airlines, and specific flights will allow users to share their travel experiences and interact with other travelers. This social aspect will provide valuable insights and recommendations to users, helping them make informed decisions and discover new travel opportunities. To cater to a wider audience and provide on-the-go access to flight information and bookings, developing a mobile version of the application for both iOS and Android platforms is essential. This mobile application will enable users to access their travel details, receive notifications, and make bookings conveniently from their smartphones or tablets.

By collecting and analyzing data on user preferences, popular routes, and flight booking trends, the application can generate valuable analytics and insights. These insights can be utilized to improve the application's features, personalize recommendations for users, and enhance the overall user experience. Additionally, implementing features such as accounting for flight delays and cancellations, as well as calculating carbon emissions for flights, will further enhance the application's functionality and provide users with valuable information for making informed travel choices.

CONCLUSION

In conclusion, the Airways application project aims to provide users with a powerful tool for planning and organizing their air travel. By modeling routes between airports as a graph and utilizing graph algorithms, the application can efficiently find the shortest path between airports, providing users with optimal flight options. The project also includes features like filtering flights, comparing prices, and enabling direct flight bookings, enhancing the user experience and convenience.
